

ABSTRACT OF THE DISCLOSURE

A track cover that is quickly and easily installed on different sizes and shapes of tracks on track vehicles that prevents dirt, gravel, or other debris may be thrown from the track of a track-type work vehicle while being transported onto the roadway. The track cover includes a flexible, elongated body designed to fit over the top and side surfaces and the side opening on a track. Attached to the lower edge of the elongated body is a durable mat that, during use, is placed over the path area of a trailer which the track vehicle is driven. Elastic cords attached at one end to the inside edge of the track, extend over the top, front, and side surfaces of the track and connect to the perimeter edge of the elongated body to hold the elongated body on the track and to keep dislodged dirt, gravel, or other debris from falling into the roadway.
